TITLE

Forecasting and Analyzing Stock Prices Using Machine Learning Models

5th June 2023

TEAM MEMBERS DETAILS

The table below shows the task assignment for team members along with their estimated time to-do them

No.	Date	Tasks	Name / Email
1	**8 Jun**	Data Specification & Pre-processing	Asrar Qaseem asrarqassem@my.unt.edu
2	**10 Jun**	Data Analysis and Integration	
3	**12 Jun**	Model Development: XGBoost (eXtreme Gradient Boosting) Model	
4	**15 Jun**	Model Development: Random Forest Model	
5	**17 Jun**	Model Development: Prophet Model	
6	**18 Jun**	Evaluation and Comparison	

PROJECT ABSTRACT

In today's dynamic and swiftly evolving financial environment, it has become increasingly difficult to accurately anticipate stock prices. Consequently, the project's primary objective is to forecast future market trends in the stock prices of significant corporations. In addition, the model concentrates on delivering highly accurate real-time stock market data values to end users, considering the inherent fluctuations that occur in stock market data over time. In addition, the model provides a variety of professional chart designs for data visualization as a means of effectively analyzing and presenting the data to the public on a yearly, monthly, and weekly basis, thereby facilitating enhanced comprehension and dissemination of the results. Therefore, there will be several benefits to the users of the project.

First, the model's capability to navigate the complexities of the stock market is highly effective, as it can efficiently process massive volumes of data. By doing so, it reveals previously undetected trends that hold the potential to impact stock pricing, offering valuable insights for analysis. Moreover, the analysis of future stock prices and the trends they reveal holds significant importance in the finance sector. Accurate forecasts are crucial for speculators, investors, and financial institutions to maximize their profits. Considering the intricate nature of the stock market, the utilization of machine learning techniques becomes indispensable. Forecasting precise stock market trends and future prices is crucial in finance for a variety of reasons, including but not limited to the following: empowering investors, facilitating risk management, supporting strategic decision-making for businesses, and contributing to overall market efficiency.

Second, I am encouraged to work on this project since the stock market is so important to the public. The stock market is important in many areas of people's financial life, such as investing, retirement planning, and asset growth. This project seeks to give users with important insights and accurate forecasts by concentrating on anticipating stock market trends and assessing future prices, allowing them to make informed decisions and maximize their financial results. Understanding stock market dynamics and applying machine learning approaches will enable consumers to navigate the market's intricacies, capture opportunities, and successfully manage their assets. This initiative intends to improve users' financial well-being and help them reach their financial objectives with confidence by contributing to the area of stock market analysis. While future outcomes cannot be guaranteed, the analysis of data and prediction can prove advantageous in formulating strategies for unforeseen future events. It is due to this reason that I have made the decision to implement machine learning-based predictions.

In summary, the model will be based on real-time data and will be updated on a regular basis, making it very useful not only for those interested in the stock market but also for anyone looking to interact with it. The model will deliver up-to-date insights and forecasts by exploiting real-time data, allowing users to keep informed about the ever-changing market circumstances. This model will provide useful information and analysis to anybody interested in the stock market, whether they are an experienced investor, new trader, or just inquisitive about it. It may help consumers make more informed choices, find possible market options, manage risks, and optimize their investing plans. As a result, with its comprehensive and active approach, this model aims to empower a wide range of individuals and enhance their engagement and success in the stock market.

Visual Flow Diagram

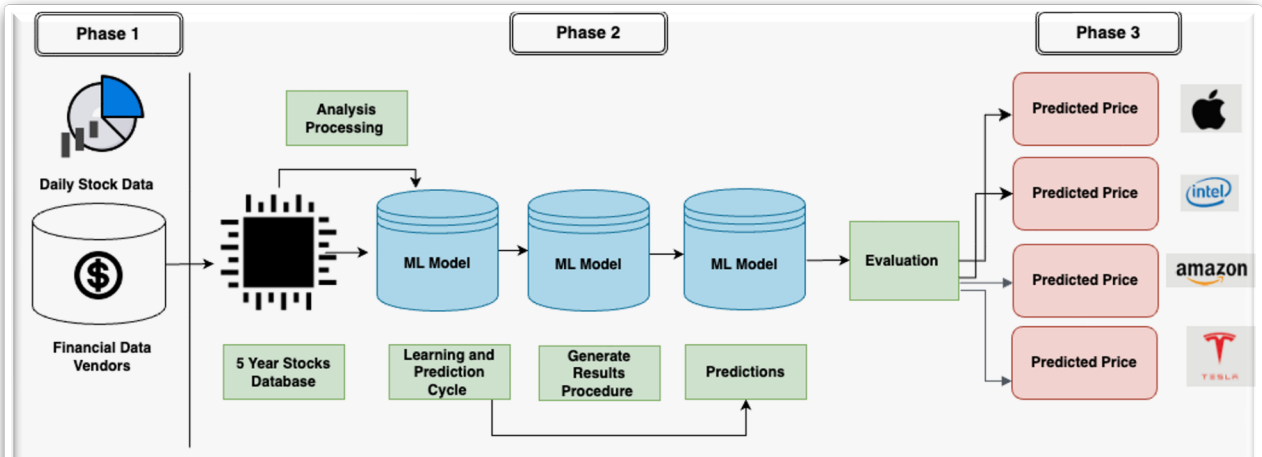

Figure 1 : Flow Diagram for Forecasting and Analyzing Stock Prices Using a Machine Learning Models

The Visual Flow Diagram (Fig.1) which I created for displaying how the model for Forecasting and Analyzing Stock Prices Using Machine Learning works and provides a comprehensive representation of the step-by-step process involved in predicting and analyzing stock prices. This diagram visually shows the sequential stages, starting with data collection and preprocessing, followed by feature selection and engineering. It then shows the model training and evaluation phase, followed by the prediction generation and performance monitoring steps. This diagram demonstrates a valuable perspective for understanding the entire process of stock price forecasting and analysis, allowing stakeholders to grasp the workflow and gain insights into the underlying mechanisms of the machine learning model.

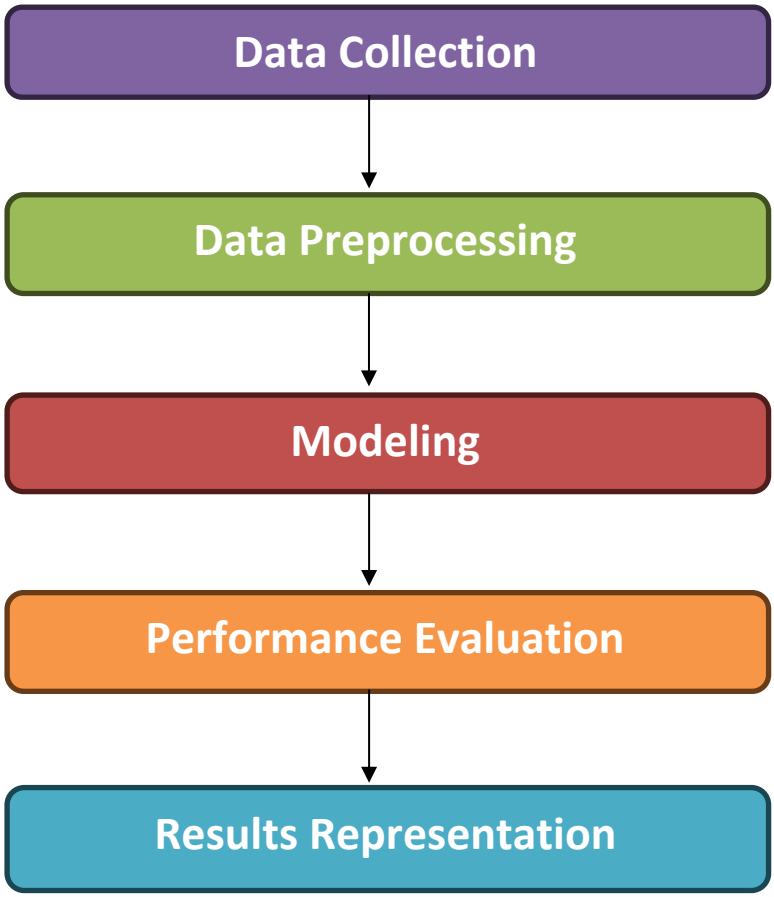
In detail, phase one of the project will primarily concentrate on data collection, data cleaning, preprocessing, and other necessary operations. This phase plays a crucial role in obtaining accurate and reliable results, which, in turn, are essential for developing a high-performing model. Data collection involves identifying and retrieving the required datasets from reliable sources, such as Yahoo Finance, while data cleaning and preprocessing involve, addressing the significant data, and transforming the data into a suitable format for analysis. These operations lay the foundation for achieving a robust and accurate model by ensuring the integrity and quality of the data used in subsequent phases of the project.

The focus of the second phase of the project will primarily be on constructing the model. This phase entails the selection of suitable machine learning models, including Random Forest, Prophet, and XGBoost, which will be trained using the preprocessed data. The objective is to design a model that can forecast and analyze stock prices by utilizing the identified features and target variables. Throughout this phase, a range of techniques such as feature selection, hyperparameter tuning, and model evaluation will be employed. Performance metrics like mean squared error (MSE) and mean absolute error (MAE) will be utilized to enhance the model's accuracy and overall effectiveness. The highest goal of this phase is to develop a robust and dependable Machine Learning model capable of accurately predicting and analyzing stock prices

based on the provided dataset. Additionally, it aims to compare and determine the best-performing model among Prophet, Random Forest, and XGBoost for forecasting future stock prices.

In the final phase of the project, the emphasis will be on testing and validating the developed model. This phase involves evaluating the model's performance and accuracy in predicting stock prices using independent test datasets derived from the original dataset. By conducting thorough testing and validation, the project aims to ensure the reliability and effectiveness of the model in generating accurate forecasts.

Project Framework for Stock Price Analysis and Prediction



PROJECT GOALS

The primary objective is to develop a model that enhances the user experience and yields accurate results in the dynamically shifting stock market. Using the Yahoo Finance dataset as the primary source of data, I aim to accurately predict future stock market prices, enabling individuals to take proactive measures and make well-informed decisions to mitigate risks and maximize returns. Consequently, the primary objectives of this Project will be:

Goal 1

The project aims to develop a data visualization based on an advanced prediction model to assist investors in making sound decisions by using Machine Learning models which are helpful to work with time series forecasting. In addition, a variety of techniques will be utilized to monitor and present statistical data on the stock market prices of various corporations.

Goal 2

I will store, analyze, preprocess, and clean the dataset by utilizing the Jupiter Notebook's capabilities as a robust workplace. This efficient workflow will guarantee that the output data are processed quickly and efficiently, maximizing their usability for the predictor model. The robust features of Jupiter Notebook enhance the data preparation process, enabling the predictor model to make the best use of the dataset. Consequently, this efficient procedure improves the overall effectiveness of the project by facilitating enhanced data quality and accelerating the subsequent phases of analysis and modeling.

Goal 3

The Random Forest algorithm can yield advanced results in my project because it offers several advantages, including accurate assessments of model performance, interpretability of predictions, comparative analysis of different models such as XGBoost, robustness to outliers in the data, and alignment with loss functions. MSE and MAE metrics play a vital role in effectively monitoring and enhancing the performance of machine learning models, making Random Forest an invaluable tool for achieving improved predictive capabilities and overall model efficacy.

Goal 4

Stock Time Analysis is a powerful technique used to process and analyze data by visualizing key information such as high and low prices, as well as weekly, monthly, and yearly averages of stock price. This analysis provides valuable insights into the historical trends and patterns of stock prices, allowing users to identify important market dynamics and make informed investment decisions. By examining the shifting trend of stock prices over various time intervals, users can gain an in-depth understanding of market behavior and potentially identify potential profits. Stock Time Analysis is a valuable instrument for understanding the past performance of stocks and navigating the complexities of the stock market.

Goal 5

In a stock market project, the objective of supervised learning is to train a model that accurately forecasts future stock prices or market trends based on historical data. Whether it is possible with the data available depends on the data's quality, completeness, and relevance, as well as the stock market's inherent predictability.

Project Design and Milestones:

Technologies and Programming languages:

→ The project relies on Jupyter Notebooks as the primary programming environment for development and analysis, with Python as the chosen programming language. Python's rich ecosystem of libraries and frameworks, including Pandas, NumPy, TensorFlow, Keras, and Scikit-learn, supports data manipulation, statistical analysis, and machine learning algorithms. Jupyter Notebooks offer an interactive and flexible workspace for code experimentation, data visualization, and analysis documentation. This combination of Jupyter Notebooks and Python enables efficient data handling and the implementation of forecasting models, making it well-suited for effective stock price forecasting and analysis tasks.

→ The project depends on important machine learning algorithms like Random Forest, XGBoost, and Prophet along with helpful libraries such as NumPy, Matplotlib, Pandas, TensorFlow, Keras, and scikit-learn. For example, when I decide to select Random Forest because itis great for predicting stock market movements because it can handle complex patterns and noisy data, leading to more accurate forecasts. In addition, XGBoost is also helpful because it can handle missing data often found in real-world stock market datasets and can identify the most important factors affecting the market. Forthermore, I use Prophet algorithm which develops by Facebook because it is designed to handle time series data with strong seasonal effects and provides accurate predictions with minimal manual adjustments.

Besides, I need also to work with NumPy which helps with efficient number operations, Matplotlib creates visual plots, Pandas handles data organization, and scikit-learn provides many useful machine learning tools. These tools and libraries make the project better at using machine learning to analyze and predict stock prices.

→ The project utilizes the Yahoo Finance API as a reliable and widely used data source for retrieving financial data. The API provides access to a diverse range of market indicators, including historical stock prices and trading volumes. By leveraging the Yahoo Finance API, the project can access real-time and historical data crucial for accurate stock price forecasting and analysis. This integration allows the project to benefit from the extensive information available through Yahoo Finance, enhancing the effectiveness and precision of the machine learning models used in the project.

→ The project incorporates PyQt5 as the preferred UI framework, utilizing its Python binding for the Qt framework. PyQt5 enables the development of visually appealing and interactive user interfaces. By leveraging PyQt5, the project enhances the user experience and facilitates intuitive interaction with the forecasting and analysis application.

Milestones List:

Milestone 1
Step 1 Data Collection and Preprocessing
- Set up an API connection to the Yahoo Finance API.
- Define the desired set of stock markets or instruments for which you want to collect real-time data. *The historical datasets of Tesla, Apple, Intel, and Amazon is going to be used in this project.*
- Implement a data retrieval mechanism to fetch the latest stock price data in real time.

Step 2 Data Transformation:
- Convert the real-time data into a suitable format for analysis, such as time series data.
- generate new data from the dataset for analyzing stock market by calculating monthly and yearly trends of prices and visualizing them.
- Ensure that the real-time data is organized and structured in a way that can be used by the machine learning model.
- Perform any necessary transformations or normalization steps required for the analysis.

Milestone 2 - Feature Selection and Engineering
- Conduct an in-depth analysis of the available data and determine which features are potentially influential in stock price forecasting such as trading volume, technical indicators, or other important features which can be helpful to achieve meaningful predictions.
- Perform feature selection techniques like correlation analysis, feature importance ranking, or domain knowledge-based selection.
- Engineer new features by combining existing ones or using domain-specific information to enhance the model's predictive power.

Milestone 3 - Model Selection and Training which will be 70% of the set.
- Choose an appropriate machine learning model for stock price forecasting, such as a Random Forest, Prophet, and XGBoost model, then split the data into training and validation sets.
- Train the selected model on the training data using appropriate algorithms and techniques.
- Utilize techniques like cross-validation and hyperparameter tuning to optimize the model's performance.

Milestone 4 - Testing the Model with Evaluation and Validation which will be 30% of the set.
- Evaluate the trained model's performance using metrics such as (RMSE) Root Mean Squared Error, which provides an average measure of the model's deviation in units and indicates how much it tends to miss in each forecast. Another metric is (MAPE) Mean Absolute Percentage Error, which assesses the percentage-wise accuracy of the forecasts, like an accuracy metric in

classification problems. In short, these metrics offer insights into the model's accuracy and precision, aiding in the evaluation of its performance.
- Validate the model by testing it on a separate validation dataset to measure its generalization capability and identify any overfitting issues.
- Analyze and interpret the evaluation results to gain insights into the model's accuracy and reliability.

Milestone 5 - Visualize, Deployment, and Real-time Prediction in Future
- Deploy the trained model for real-time stock price prediction.
- Develop a user-friendly interface or application to allow users to access the predictions conveniently.
- Continuously analyze incoming data and generate forecasts, providing users with valuable insights to support their investment decisions.

Milestone 6 - Performance Monitoring and Comparative Analysis.
- Establish a systematic monitoring process to regularly assess the performance of the deployed model.
- Monitor key performance metrics to ensure the accuracy, robustness, and reliability of the model's predictions.
- Continuously compare the model's predictions with the actual stock prices to identify any disparities or deviations.
- Analyze the discrepancies and explore potential reasons behind the gaps between predicted and actual values.

Resources and Related Project

1- Using Academic Resources: I have searched for scholarly articles, research papers, and sessions relating to stock price analysis and forecasting. For accessing such resources, websites like Google Scholar, which is useful. For instance, I read this paper to learn more about Machine Learning Algorithms in Stock Market Prediction and how can use them in my project.[1]
2- Joining online communities and discussions relating to machine learning, finance, and stock market analysis. Platforms such as Kaggle, Reddit, GitHub, and Stack Exchange typically have active communities where I can find insightful discussions and valuable insights on pertinent topics.
For example, I learn how to build model using Xgboost, and learn more about GridSearchCV to evaluate model based on training and validation sets [2]. In addition, from [3] I learn more about using Python to do the project of prediction future stock market.
3- Open-Source Libraries and Code Repositories which are useful to explore open-source libraries and code repositories like GitHub or GitLab. Many projects related to stock market analysis and prediction are shared openly, allowing to study their code and implementation. For Example, I use these websites to learn more about ML in stock prediction. From [4][5][6][7], I have learned how to use Yahoo finance API by using the libraries YFinance and how to collect Stock data based on

specific period of time. In addition, from [8] I have learned about Prophet algorithm which is useful to predict upcoming and forwarding dates in future.

4- From [9], I have found and bought some several useful online courses or tutorials which are commercial, and they aim machine learning for financial or stock market analysis from Udemy, and edX which offer a variety of courses taught by subject matter specialists. Nevertheless, I have taken many advantages from free online courses such as from YouTube and others, such as [11], and from [10] which is useful article I have learned more about how we can split the dataset into training and testing sets.
